Experience in the Design and Construction (Cont.)

SOV/5510

COVERAGE: The book provides a generalized discussion of experience gained in the production of prestressed bridge components and the assembly of prestressed bridges in Belorussia. Special attention is given to the production, preparation, and mounting of prestressed components. Chapters VI and VII were written by Ya. I. Drozd; Ch. III and the Appendixes by N.A. Tkachenko; Ch. II by I.M. Gel'fman; Chs. IV and V by V.I. Volynskiy. The authors thank Ya. D. Livshits, Doctor of Technical Sciences, Engineer I.I. Grigorovich, Head of the Gushosdor (Main Administration of Highways) of the Council of Ministers of the BSSR, and A.F. Kravukhin, Engineer. There are 37 references, all Soviet (including 2 translations).

TITLE: A telescope of spark counters in a magnetic field;
an apparatus for measuring pulses of fast charged
particles

PERIODICAL: Pribory i tekhnika eksperimenta, 1961, No.2, pp. 47-52

TEXT: The design of the spark counters employed in this work is illustrated in Figs. 1 and 2. In Fig.2 the notation is as follows: 1 - perspex; 2 - glass; 3 - conducting layer; 4 - rubber, 5 - TiO_2 + Lac; 6 - Teflon or polystyrene. A pumping line is provided through which the counter can be evacuated and then filled with the required gas. The upper electrode is in the form of a conducting layer of SnO_2 and its thickness is 1.7 mm. The observation and photography of the spark discharge is carried out through the upper electrode. The lower electrode is in the form of an aluminium foil mounted on glass. The distance between the electrodes is 2 mm and depends on the size of the cylindrical inserts shown in Fig.2. Edge effects giving rise to breakdown are prevented by the TiO_2 lac coating. Dry air at 1 atm was at first

tried as the working gas, as suggested by J.E. Cranshaw and I.F. de Beer (Ref.3: Nuovo cimento, 1957, 5, No.5, 1107). However, air was found to be unsatisfactory because of spurious sparks and other effects. The final working gas was a mixture of dry air (dried with P_2O_5), argon (300 mm Hg) and C_2H_5N at a total pressure of 1 atm. Since perspex will gradually absorb pyridine, it is necessary to operate the counter with the pyridine vapour pressure very nearly at the saturation value. This is ensured by introducing about 1 cm³ of pyridine into the working volume in a special container. Fig.3 shows the circuit employed in testing and in efficiency measurements. The spark counter NC (IS) is placed in a telescope consisting of two sets of geiger counters GC (GS). When the particle passes through the system a positive pulse is produced by the coincidence circuit which triggers the TGI 1-325/16 (TGI 1-325/16) thyatrons. Two pulses (with opposite polarities) are produced at the points K and L when the two L-C lines discharge through the thyatrons.

A telescope of spark counters in a magnetic field; an apparatus for measuring pulses of fast charged particles

They are 0.5 μ sec long and are applied to the plates of the spark counter. The pulses are delayed by about 1.0 μ sec relative to the entry of the particles. A constant clearing voltage (8 V) is also applied across the counter. Another circuit in which the counters were operated with exponential voltage pulses is shown in Fig.36 (J.E. Cranshaw and I.F. de Beer, Ref.3). The mechanical counter MC I was used to record the total number of twofold coincidences while the mechanical counter MC II recorded the number of spark counter operations. The spark discharge in the counter was recorded by the small microphone M. Argon-filled counters have also been investigated using the circuit shown in Fig.36 and the results will be described separately (V.Kh. Volynskiy, M.I. Dayon, A.K. Ponomov, PTE, 1961 (to be published) Ref.5). Fig.4 shows the efficiency of the present counter as a function of the applied voltage. This curve was obtained at room temperature (20 ± 3 °C). As a rule, the length of the plateau exceeds 1000 volts. This curve was obtained by triggering the thyatron system with pulses

EO32/E114

A telescope of spark counters in a magnetic field: an apparatus for measuring pulses of fast charged particles

from a special oscillator. The second part of the present paper is concerned with the spark counter telescope placed in the magnetic field. The telescope consists of three counters placed in the gap of an electromagnet, gap size $60 \times 20 \times 10 \text{ cm}^3$. The maximum field was 6300 oe. The working area of each counter plate was $100 \times 200 \text{ mm}^2$. The spark discharge was photographed by three cameras on a single film as shown in Fig.5. The notation in Fig.5 is as follows: 1,2,3 - objectives; 4,5,6 - mirrors; 7,8,9 - coordinate grids; 10,11,12 - spark counters; 13,14,15 - geiger counters. The grids were specially illuminated so that the sparks could be seen against them and their coordinates easily measured. The voltage was applied to the spark counters when there was a coincidence between pulses from a series of three thin-walled geiger counters. It was found in about 97% of cases the root mean square distance of the spark from the particle trajectory was about 0.2 mm. The telescope has been used to measure the momenta of fast charged particles ($\sim 10^{10} - 10^{11} \text{ ev/c}$). A similar

Mekhanizatsiya i avtomatizatsiya trudovskikh protsessov v liternom proizvodstve (Mechanization and Automation of Labor-consuming Processes in Foundry Practices) Moscow: Mashgiz, 1959. 226 p. Errors slip inserted. 4,000 copies printed.

Reviewed: K. N. Sushkov, Candidate of Technical Sciences; Ed. (Title page) G. I. Koblyarskiy (Deceased); Ed. (Inside Book) O. F. Sokolov, Candidate of Technical Sciences; Tech. Ed. O. V. Serebrenikov; Managing Ed. for Literature on the Technology of Machinery Manufacture (Leningrad Division, Mashgiz) Ye. P. Kuznetsov, Engineer.

PURPOSE: The book is intended for technical personnel in foundries and engineers engaged in the mechanization and automation of industrial processes. It may also be used by students of institutions of higher technical education.

COVERAGE: The book deals with recent achievements in the mechanization and automation of time-consuming labor-consuming operations in foundries. Specific instances of mechanization and automation of foundry processes are described. The material presented in this book is divided into six parts, dealing with the following subjects: melting materials, solid and coramaking, casting, treatment of castings, finishing of castings, and special casting methods. Each part consists of a number of technical papers presented by several authors. The application of automation ranges from the preparation of molds and cores to the mechanization and streamlining of specialized casting methods, such as investment casting and the use of shell molds. There are numerous diagrams showing automated and mechanized installations in foundries. Most of the material is based on experiments and work done at the "Krasnyy Almaz" Plant. Some of the methods described appear to be in the experimental stage at this plant. The technical papers published in this book originally presented at a technical conference of the Soviet machine industry in October, 1957. No personalities are mentioned.

TITLE: The Employment of Highly Aluminous Bricks in the Head-Pieces of the Regenerators of Open-Hearth Furnaces (Sluzhba vysokoglinozemistogo kirpicha v nasadkakh regenerátorov martenovskikh pechey)

PERIODICAL: Ogneupory, 1958, Vol 23, Nr 3, pp 109-111 (USSR)

ABSTRACT: Highly aluminous bricks were built into the regenerators of an 80 t open-hearth furnace, where they were tested. The open-hearth furnace worked with solid case-hardened material and was heated with oil. The bricks, which were produced by the Semiluksk plant for refractories, were placed into the 12 top rows of air-head-pieces, where temperatures of 1350-1420° and 1500° were attained. These bricks were found to be superior to fire clay bricks. Furthermore, the chemical composition and properties of highly aluminous bricks are given as well as their structure. According to calculated data these bricks contain 61% mullite, 22% siliceous glass, and 17% corundum, which must be looked upon as unfavorable because siliceous glass has a low viscosity when liquefied. The presence of 22% siliceous glass is indicative of a not completed reaction be-

Card 1/2

The Employment of Highly Aluminous Bricks in the
Head-Pieces of the Regenerators of Open-Hearth Furnaces

131-3-5/16

tween clay and technical alumina. The bricks contain much corundum, not enough mullite, and an excess quantity of glass, which reduces their slag-resistance. The bricks withstood 705 smelts, i.e. twice as many as ordinary fire clay bricks. After having been used the bricks of the uppermost row had a considerable amount of slags and showed much wear; three different zones could be distinguished (see table), which are described in detail. The following conclusions are drawn: 1.) The highly aluminous bricks showed great durability and were found to be superior to Forsterite-, Chromodinas- and fire clay bricks. 2.) The main cause of wear is the destruction of their mullite phase and the simultaneous formation of phases of low resistance at high temperatures. The phases Fe_2SiO_4 , Zn_2SiO_4 and $\text{FeO} \cdot \text{Fe}_2\text{O}_3$ are concerned here. Better results may be expected from using refractory-mullite, corundum-mullite, or corundum products, which contain smaller quantities of silicon oxide. There is 1 table and 1 Soviet reference.

TITLE:

The Action of Chromoaluminous Bricks in the Checker Chambers of Open-hearth Furnaces (Sluzhba khromoglinozemistogo kirpicha v nasaqkakh regenerátorov martenovskikh pechey)

PERIODICAL:

Ogneupory, 1959, Nr 4, pp 171-172 (USSR)

ABSTRACT:

In the Izhora works chromoaluminous bricks were tested which had been produced in the Semiluki refractories works. T. S. Lebedeva and V. F. Zamsh assisted in this investigation (Ref 1). The test bricks were built into the upper 3-6 rows of the checker chambers of two Open-hearth Furnaces which were operating on a solid layer and were heated with mazut. The maximum temperature in the checker chambers was 1400-1550° and the stability of the test bricks amounted to 368 to 377 melts. After 368 melts samples were taken from these bricks, and it was found that those from the first checker row were considerably scorious and bloated. The chemical composition of these bricks is given in the table and shows that they were considerably saturated with iron, silicon, calcium and alkali metal oxides after 368 melts. Conclusions: The chromoaluminous bricks of the upper rows of the checker chambers are

Checker Chambers of Open-hearth Furnaces

SOV/131-59-4-8/16

considerably intergrown with melting dust after work and show cracks and bloatings which cause a premature aging of the Martin furnaces. In order to obtain better working results of these bricks in the checker chambers a reliable method of their cleaning must be devised, the heat resistance of the bricks increased and their bloating reduced. There are 1 table and 3 Soviet references.

VOLYNSKIY Z.M.		EFFECT AND PROPERTIES INDEX																																																																																																				
CA	<p><i>Effect of ascorbic acid on the state of the liver in acute disorders. Z. M. Volynskiy. Khim. Med. (U.S.S.R.) 23, No. 9, 48-55 (1946). Ascorbic acid (I) is a valuable auxiliary agent in the treatment of acute disorders of the liver. Intravenous administration of 300-500 mg. of I in acute epithelial hepatitis led to a decrease of blood bilirubin for about 1-3 hrs. No hemolytic action was observed. Study of urobilinuria in rabbits and with or without the admin. of 10-25 mg. I (subcutaneously). I caused a lesser elimination of urobilin in comparison with CCl₄ alone (all expts. showed much individual variation). In CCl₄-induced hepatitis the glycemic curves after administration of I are little changed from normal, while in the absence of I they acquire a more and more pathological quality. On the basis of tests with galactose it appears that I tends to raise the poisoning threshold of the liver by CCl₄. Liver glycogen in CCl₄-ascorbic acid treated animals was about 2.5%, while CCl₄ controls gave but 1.4%; the I levels in the liver were 12.3 mg. % and 7.8 mg. % resp.</i></p>

Effect of ascorbic acid on protein-nitrogen metabolism in experimental damage of the liver. Z. M. Volynskii. *Arkh. Patol.* 12, No. 6, 30-4(1930).—Rabbits whose liver was damaged by CCl₄ administration display an increase of polypeptide level in the urine and blood, which may be used as an index of extent of liver cell damage. Administration of ascorbic acid is an effective measure for decreasing the magnitude of this disturbance by enhancing the proteolytic and deaminating functions of the liver. A 50 mg. daily dosage along with the CCl₄ injections gave a clear indication of the protective action of ascorbic acid. G. M. K.

Break-up of drops in an air stream. M. S. Volynsky (C. H. Acad. Sci., *Prilozh.*, 1944, 22, 301-304).—Drops of known size of various liquids were allowed to fall past the orifice of a horizontal tube through which air streamed at controlled rates of flow. The break up of the drops was studied photographically and also by catching them in castor oil, followed by microscopical examination. At a certain critical rate of flow the drops became unstable and broke up. With d the original diameter in m , ρ density of the air in $kg. per cu. m.$, γ the capillary const. of the liquid in $kg. per m.$, V_0 $m. per sec.$ the rate of flow at the lower limit of stability (*i.e.*, when only 10-20% of the drops broke up), and V_{∞} the rate at the upper limit of stability (*i.e.*, when all the drops just broke up), a dimensionless value $D = \rho V_0^2 d / \gamma$ was found to be a const. (14) for all the liquids (Hg, water, tetraethanothane, hexosane, ethanol, and benzole). At the lower limit of stability the corresponding value was 10.7.

TITLE: Improving Labor Productivity at the "Lenstankolit"
Plant (Iz opyta raboty po povysheniyu proizvoditel'nosti
truda na zavode "Lenstankolit")

PERIODICAL: In sbornik: Povysheniye proizvoditel'nosti truda v
liteynom proiz-ve, Moscow-Leningrad, Mashgiz, 1955, pp. 115-122.

ABSTRACT: Improved technological processes made it possible for the
plant to increase its output of castings by 86%, the
efficiency of its molders by 77%, and reduce casting
rejects to 3.8%. These results were due to the following:
1) the use of semi-permanent molds and cores which in-
creased the number of pourings to 15; 2) the application

123-1-393

Improving Labor Productivity at the "Lenstankolit" Plant (Cont.)

of a combined molding method for parts with rotating outer surface sections, in which the main part is cast in floor molds, and the rest - by pattern casting; 3) by making use of sectional, readily removable dead heads, metal consumption was reduced from 30% to 10% of the weight of the castings; 4) by increasing the pressure of the water stream used in hydraulic descaling to 100 atm from the original 35 atm the throughput of the descaling unit was raised to 3.6 ton/hour as compared to its former output of 1.5 t/h.; 5) by using single-cable grab buckets for digging trenches for floor molds, a method which makes it possible to suspend these buckets from any given bridge crane.

TITLE: The application of spectral functions to the investigation of variability of oceanographic features

SOURCE: Moscow. Tsentral'nyy institut prognozov. Trudy, no. 142, 1965. Morskiye prognozy i raschety (Marine forecasts and calculations); materialy Vsesoyuznogo soveshchaniya, noyabr' 1963 g., 103-107

TOPIC TAGS: autocorrelation function, ocean dynamics, white noise

ABSTRACT: Temperature and current variability in water masses in time were investigated as a function of oscillation durations of a few hours to a few days on the basis of data obtained from seven stations located in the Atlantic, Indian, and Pacific Oceans and the Barents Sea. The spectral density $S(\omega)$ of a stationary random function was expressed through the correlation function $R(\tau)$ using the Fourier transform

$$S(\omega) = \frac{2}{\pi} \int_0^{\infty} R(\tau) \cos \omega \tau d\tau.$$

Autocorrelation and spectral density function values were plotted after solving the

Card 1/2

L 40911-66

ACC NR: AT6006583

integral equation. The selection of the maximum permissible displacement in the evaluation of autocorrelation and spectral density functions was made using the Jukey method (1958). The study shows that 1) in many cases, temperature and current changes are characterized by periodic oscillations; 2) temperature and current oscillations of 12.4 hr periods are activated by tidal forces; 3) oscillations of 13-25 hr periods are of inertial type; and 4) oscillations of 30-33 hr and 70-80 hr periods are stimulated by atmospheric changes.
